

DHARANI KIRAN C S.

FULL-STACK DEVELOPER

Full-stack engineer who traces problems to root cause before writing code. Built production systems solo, led an 8-developer team on a statewide government platform, and shipped cross-platform mobile end to end.

EXPERIENCE

3+ Years

FOCUS

Full-Stack · Workflow Automation

CORE STACK

React · Node · Python

EDUCATION

M.Sc. IT · Anna Univ. (CEG)

§01 WORK HISTORY

Experience

- Associate Engineer

Sapphireims · Chennai

Dec 2025 — Present

 - Design and maintain BPMN process automation in Camunda with custom delegate services for enterprise workflow pipelines.
 - Build complex enterprise business forms and data-driven workflow automation end to end, from intake to reporting.
 - Develop and optimize SQL queries and JSON-based data sync for reporting, extraction, and platform migrations.
 - Automate bulk data migrations with Python and pandas, syncing Excel master data into platform JSON stores.
- Software Development Engineer

TK Propeller Digital Solutions LLP · Chennai

Aug 2023 — Nov 2025

 - Solo-built a petroleum logistics platform end to end, covering frontend (React), backend (Node), database (PostgreSQL), and third-party API integrations.
 - Investigated the client's loading/unloading and weighbridge process on-site, then rebuilt the discrepancy-detection algorithm around it. Cut flagged discrepancies from 20-30 per week to a residual 1-2, with a documented manual-override path for the rest.
 - Designed full UI/UX in Figma for two React Native apps, every screen from wireframe to high-fidelity, then built the interfaces with React Native and NativeBase, extending frontend skills from web React to cross-platform mobile.
 - Maintained code quality through unit and integration testing across both platforms, reducing post-deployment issues.
- Software Development Engineer Intern

Vertace Consultant · Chennai

Jan 2023 — May 2023

 - Recognized for technical contribution among a 10-intern cohort and promoted to lead an 8-developer team on TANFED, a Tamil Nadu state government platform mandated for rollout across every taluk and regional cooperative office. Owned task delegation and code review alongside hands-on ReactJS development.
 - Built the invoice/receipt PDF generation and SMS notification integration for TNeGA, Tamil Nadu's e-governance ration distribution (PDS) platform serving every household in the state.
- Full Stack Developer Intern

Quantumics A.I. · Remote (London)

Jun 2021 — Dec 2021

 - Engineered RESTful APIs enabling efficient manipulation and management of dynamic datasets.
 - Collaborated cross-functionally to analyze problems and ship data-driven solutions that improved system performance.

§02 CASE STUDIES

Projects

01 / 03

Rasha — Petroleum Logistics Platform

Built a petroleum logistics platform solo, covering frontend, backend, and third-party API integrations, after the client was flagging 20-30 discrepancy cases a week from fuel evaporation, theft, and gross/net weight mismatches between loading and unloading. Investigated the weighbridge process on-site and rebuilt the discrepancy-detection algorithm around what was actually happening on the ground, adding a manual-override entry (with required documentation) for whatever remained.

Result: weekly discrepancies down to a residual 1-2, each one auto-resolved or explicitly documented.

React.js · Node.js · PostgreSQL · RBAC · REST APIs

02 / 03

TANFED — Statewide Government Platform

Recognized for technical contribution among 10 interns and promoted to lead an 8-developer team on TANFED, a ReactJS platform for Tamil Nadu's taluk and regional cooperative offices. Split time between task delegation, code review, and hands-on development.

Result: shipped and rolled out across every taluk and regional cooperative office in the state.

React.js · Government Systems · Team Leadership · Code Review

03 / 03

Kalci — Personal Finance Tracker

Personal project. An offline-first Android app that reads incoming bank SMS, filters against known DLT bank shortcodes, and auto-logs debit transactions as pending entries, so day-to-day spend needs no manual entry. Covers budget tracking, a full transaction ledger, EMI/loan amortization with real tenure math, and investments including India-specific chit-fund payouts. A custom Kotlin native module drives a live home-screen balance widget.

Result: zero manual entry for routine spend tracking, with a native widget shipped through a custom platform module.

React Native · Expo · TypeScript · WatermelonDB · Kotlin
